

# Crazy for Canteens

*Submitted by Tom Stranko*

Having bought my third copper canteen, I now see there are different styles according to how the seams are made. The two on the left have the body folded horizontally and the top cone seam. The one on the right has two vertical seams but no horizontal seam for the top cone.

These photos show the difference in construction in terms of solder seams. The flask on the left has three seams compared to its cousin on the right which lacks a seam at the shoulder.

Below is a simple tin flask.

At left is a powder flask with a built-in squib container. While my most recent \$10 purchase is below:
